

# CAT3643

## 3-Channel Ultra High Efficiency LED Driver

### Description

The CAT3643 is a high efficiency fractional charge pump that can drive up to three LEDs programmable by a one wire digital interface. The inclusion of a 1.33x fractional charge pump mode increases device efficiency by up to 10% over traditional 1.5x charge pumps with no added external capacitors.

Low noise input ripple is achieved by operating at a constant switching frequency which allows the use of small external ceramic capacitors. The multi-fractional charge pump supports a wide range of input voltages from 2.4 V to 5.5 V.

The EN/DIM logic input functions as a chip enable and a digital dimming interface for current setting of all LEDs. Six different current ratios are available via the interface.

The device is available in the 16-pad TQFN or 12-pad TDFN 3 mm x 3 mm package with a max height of 0.8 mm.

ON Semiconductor's 1.33x charge pump switching architecture is patented.

### Features

- High Efficiency 1.33x Charge Pump
- Charge Pump: 1x, 1.33x, 1.5x, 2x
- Drives up to 3 LEDs at 32 mA Each
- Power efficient 12-pad TDFN and 16-pad TQFN Packages

### MARKING DIAGRAMS

These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant Applications

## Unused LED Channels

For applications not requiring all the channels, it is recommended the unused LED pins be tied directly to  $V_{OUT}$  (see Figure 30).

Figure 30. Application with 2 LEDs

## Protection Mode

If an LED is disconnected, the driver senses that and automatically ignores that channel. When all LEDs are disconnected, the driver goes to 1x mode where the output is equal to the input voltage.

As soon as the output exceeds about 6 V, the driver resets itself and reevaluate the mode.

If the die temperature exceeds +150°C, the driver will enter a thermal protection shutdown mode. When the device temperature drops by about 20°C, the device will resume normal operation.

## LED Selection

LEDs with forward voltages ( $V_F$ ) ranging from 1.3 V to 4.3 V may be used. Selecting LEDs with lower  $V_F$  is recommended in order to improve the efficiency by keeping the driver in 1x mode longer as the battery voltage decreases.

For example, if a white LED with a  $V_F$  of 3.3 V is selected over one with  $V_F$  of 3.5 V, the driver will stay in 1x mode for lower supply voltage of 0.2 V. This helps improve the efficiency and extends battery life.

## External Components

The driver requires four external 1  $\mu$ F ceramic capacitors for decoupling input, output, and for the charge pump. Both capacitors type X5R and X7R are recommended for the LED driver application. In all charge pump modes, the input current ripple is kept very low by design and an input bypass capacitor of 1  $\mu$ F is sufficient.

In 1x mode, the device operates in linear mode and does
