APPLICATION INFORMATION

Detailed Description

The FAN4010 measures the voltage drop ( $V_{SENSE}$ ) across an external sense resistor in the high-voltage side of the circuit.  $V_{SENSE}$  is converted to a linear current via an internal operational amplifier and precision  $100\ \Omega$  resistor. The value of this current is  $V_{SENSE}/100\ \Omega$  (internal). Output current flows from the  $I_{OUT}$  pin to an external resistor  $R_{OUT}$  to generate an output voltage proportional to the current flowing to the load.

Use the following equations to scale a load current to an output voltage:

$$V_{SENSE} = I_{LOAD} \cdot R_{SENSE} \quad (\text{eq. 1})$$

$$V_{OUT} = 0.01 \times V_{SENSE} \times R_{OUT} \quad (\text{eq. 2})$$
