Please note: As part of the Fairchild Semiconductor integration, some of the Fairchild orderable part numbers will need to change in order to meet ON Semiconductor's system requirements. Since the ON Semiconductor product management systems do not have the ability to manage part nomenclature that utilizes an underscore (_), the underscore (_) in the Fairchild part numbers will be changed to a dash (-). This document may contain device numbers with an underscore (_). Please check the ON Semiconductor website to verify the updated device numbers. The most current and up-to-date ordering information can be found at www.onsemi.com. Please email any questions regarding the system integration to Fairchild_questions@onsemi.com.

FOD8314, FOD8314T

1.0 A Output Current, Gate Drive Optocoupler in Stretched Body SOP 6-Pin

Features

- FOD8314T - 8 mm Creepage and Clearance Distance, and 0.4 mm Insulation Distance to Achieve Reliable and High-Voltage Insulation
- 1.0 A Output Current Driving Capability for Medium-Power IGBT/MOSFET
 - Use of P-Channel MOSFETs at Output Stage

FOD8314, FOD8314T — 1.0 A Output Current, Gate Drive Optocoupler in Stretched Body SOP 6-Pin

Safety and Insulation Ratings

As per DIN EN/IEC60747-5-5, this optocoupler is suitable for “safe electrical insulation” only within the safety limit data. Compliance with the safety ratings shall be ensured by means of protective circuits.

Notes:

9. Propagation delay t_{PHL} is measured from the 50% level on the falling edge of the input pulse to the 50% level of the falling edge of the V_O signal.
10. Propagation delay t_{PLH} is measured from the 50% level on the rising edge of the input pulse to the 50% level of the rising edge of the V_O signal.
11. PWD is defined as $|t_{PHL} - t_{PLH}|$ for any given device.
12. The difference between t_{PHL} and t_{PLH} between any two FOD8314 parts under the same operating conditions, with equal loads.
13. Common mode transient immunity at output high is the maximum tolerable negative dV_{cm}/dt on the trailing edge of the common mode impulse signal, V_{CM} , to ensure that the output remains high (i.e., $V_O > 15.0 \text{ V}$).
14. Common mode transient immunity at output low is the maximum tolerable positive dV_{cm}/dt on the leading edge of the common pulse signal, V_{CM} , to ensure that the output remains low (i.e., $V_O < 1.0 \text{ V}$).
