## MAXIMUM RATINGS\*

Rating	Symbol	Value	Unit
Input Voltage Range ( $V_{in}$ to GND)	$V_{in}$	-0.3 to 6.0	V
Output Voltage Range ( $V_{out}$ to GND)	$V_{out}$	-6.0 to 0.3	V
Output Current (Note 1)	$I_{out}$	100	mA
Output Short Circuit Duration ( $V_{out}$ to GND, Note 1)	$t_{SC}$	Indefinite	sec
Operating Junction Temperature	$T_J$	150	°C
Power Dissipation and Thermal Characteristics			
Thermal Resistance, Junction to Air	$R_{\theta JA}$	256	°C/W
Maximum Power Dissipation @ $T_A = 70^\circ\text{C}$	$P_D$	313	mW
Storage Temperature	$T_{stg}$	-55 to 150	°C

Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

### \*ESD Ratings

ESD Machine Model Protection up to 200 V, Class B  
ESD Human Body Model Protection up to 2000 V, Class 2

**ELECTRICAL CHARACTERISTICS** ( $V_{in} = 5.0$  V for MAX828  $C_1 = C_2 = 10$   $\mu\text{F}$ , for MAX829  $C_1 = C_2 = 3.3$   $\mu\text{F}$ ,  $T_A = -40^\circ\text{C}$  to  $85^\circ\text{C}$ , typical values shown are for  $T_A = 25^\circ\text{C}$  unless otherwise noted. See Figure 20 for test setup.)

Characteristic	Symbol	Min	Typ	Max	Unit
Operating Supply Voltage Range ( $R_L = 10$ k)	$V_{in}$	1.5 to 5.5	1.15 to 6.0	-	V

MAX829:  $C_1 = C_2 = C_3$

## Capacitor Selection

In order to maintain the lowest output resistance and output ripple voltage, it is recommended that low ESR capacitors be used. Additionally, larger values of  $C_1$  will lower the output resistance and larger values of  $C_2$  will reduce output voltage ripple. (See Equation 3).

Table 1 shows various values of  $C_1$ ,  $C_2$  and  $C_3$  with the corresponding output resistance values at 25°C. Table 2 shows the output voltage ripple for various values of  $C_1$ ,  $C_2$  and  $C_3$ . The data in Tables 1 and 2 was measured not calculated.

## MAX828, MAX829

The MAX828 / 829 primary function is a voltage inverter. The device will convert 5.0 V into -5.0 V with light loads. Two capacitors are required for the inverter to function. A third capacitor, the input bypass capacitor, may be required depending on the power source for the inverter. The performance for this device is illustrated below.

**Figure 42. Paralleling Devices for Increased Negative Output Current**

An increase in converter output current capability with a reduction in output resistance can be obtained by paralleling two or more devices. The output current capability is approximately equal to the number of devices paralleled. A single shared output capacitor is sufficient for proper operation but each device does require its own pump capacitor. Note that the output ripple frequency will be complex since the oscillators are not synchronized. The output resistance is approximately equal to the output resistance of one device divided by the total number of devices paralleled. The performance characteristics for a converter consisting of two paralleled devices is shown below.

Figure 48. Positive Output Voltage Doubler with High Current Capability

All of the previously shown converter circuits have been constructed by incorporating combinations of the form of a negative output inverter with a positive output doubler. In Figures 52 and 53 the positive doubler has a constant  $I_{out}$  and 55 the negative inverter has the constant  $I_{out} = 15$

outputs. Applications requiring multiple outputs can be constructed. The converter shown above combines Figures 24 and 36 to form a dual output converter. Different combinations of load regulation are shown below. In Figure 54 the negative inverter has the variable load. In Figure 55 the positive doubler has the variable load.
