3.3 V Serial Input MultiProtocol PLL Clock Synthesizer, Differential LVPECL Output

NB4N441

Description

The NB4N441 is a precision clock synthesizer which generates a

QFN-24 MN SUFFIX CASE 485L

MARKING DIAGRAM*

*For additional marking information, refer to Application Note <u>AND8002/D</u>.

PLL Lock Detect Output

- Output Enable
- Fully Integrated PhaseLock Loop with Internal Loop Filter
- Operating Range: &C = 3.135 V to 3.465 V
- Small Footprint 24 Pin QFN
- These Devices are PEree and are RoHS Compliant

ORDERING INFORMATION

Device	Package	Shipping [†]
NB4N441MNG	QFN-24 (Pb-Free)	92 Units / Tube

+For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specifications Brochure, BRD8011/D.

Table 4. ATTRIBUTES

Characteristics	Value
Internal Input Pullup Resistor	37.5kΩ
Internal Input Pulldown Resistor	75kΩ
ESD Protection Human Body Model Machine Model	> 1000 V > 150 V
Moisture Sensitivity (Note 1)	Level 1
Flammability Rating Oxygen Index: 28 to 34	UL 94 V–0 @ 0.125 in
Transistor Count	2102

Symbol	Characteristic	Min	Тур	Мах	Unit
I _{CC}	Power Supply Current (Inputs and Outputs Loaded)	50	70	90	mA
I _{CCPLL}	PLL Power Supply Current	10	20	30	mA
V _{OH}	LVPECL Output HIGH Voltage (Notes 4 and 5) $$V_{\rm CC}$=3.3$$	V _{CC} – 1145 V 2155	V _{CC} – 1030 2270	V _{CC} – 895 2405	mV
V _{OL}	LVPECL Output LOW Voltage (Notes 4 and 5) $$V_{\rm CC}$$ = 3.3	V _{CC} – 1945 V 1355	V _{CC} – 1760 1540	V _{CC} – 1695 1605	mV
VOHTTL	Output HIGH Voltage (\overline{LOCKED} Pin) $I_{OH} = -0.8$ n	A 2.5		V _{CC}	V
V _{OLTTL}	Output LOW Voltage (LOCKED Pin)	GND		0.4	V
V _{IH}	Input HIGH Voltage (LVTTL/LVCMOS)			V _{CC}	V
V _{IL}	Input LOW Voltage (LVTTL/LVCMOS)	GND		0.8	V
I _{IH}	$ \begin{array}{llllllllllllllllllllllllllllllllllll$	ax 6.0 ax 20 ax 20		26 60 60	μΑ μΑ
Ι _{ΙL}	Input LOW Current V _{IN} = 0.5 V, VCC _m	ах		10	μΑ

Table 6. DC CHARACTERISTICS V_{CC} = 3.135 V to 3.465 V, GND = 0 V, T_A = -40°C to +85°C

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm.

4. LVPECL Outputs loaded with 50 Ω termination resistors to V_{TT} = V_{CC} - 2.0 V for proper operation. 5. LVPECL Output parameters vary 1:1 with V_{CC}.

Table 7. AC CHARACTERISTICS V_{CC} = 3.135 V to 3.465 V, GND = 0 V, T_A = -40° C to $+85^{\circ}$ C (Note 6)

Symbol	Characteristic	Min	Тур	Max	Unit
fın	Crystal Input Frequency External CLOCK Input Frequency (Pin 8) SCLOCK	10	27 27	28 50 10	MHz
V _{OUTPP}	Output Voltage Amplitude	600	800		mV
f _{VCO}	VCO Frequency Range	400		850	MHz
f _{CLKOUT}	Output Clock Frequency Range	12.5		425	MHz
t _{R/} t _{F_IN}	Input Clock Rise and Fall Time (CLK, Pin 8) (Note 7)			10	ns
^t LOCK	Maximum PLL Lock Time		0.5	5	ms
DCO	Output CLOCK Duty Cycle (Differential Configuration)	48		52	%

Jitter Performance

Jitter is a common parameter associated with clock generation and distribution. Clock jitter can be defined as the deviation in a clock's output transition from its ideal position.

Cycle-to-Cycle Jitter (short term) is the period variation between two adjacent cycles over a defined number of observed cycles. The number of cycles observed is application dependent but the JEDEC specification is 1000 cycles.

Peak-to-Peak Jitter is the difference between the highest and lowest acquired value and is represented as the width of the Gaussian base.

Figure 9. Peak-to-Peak Jitter

There are different ways to measure jitter and often they are confused with one another. The typical method of measuring jitter is to look at the timing signal with an oscilloscope and observe the variations in period to period or cycle to cycle. If the scope is set up to trigger on every rising or falling edge, set to infinite persistence mode and allowed to trace sufficient cycles, it is possible to determine the maximum and minimum periods of the timing signal. Digital scopes can accumulate a large number of cycles, create a histogram of the edge placements and record peak to peak as well as standard deviations of the jitter. Care must be taken that the measured edge is the edge immediately following the trigger edge. These scopes can also store a finite number of period durations and post processing software can analyze the data to find the maximum and minimum periods.

Recent hardware and software developments have resulted in advanced jitter measurement techniques. The Tektronix TDS series oscilloscopes have superb jitter analysis capabilities on non contiguous clocks with their histogram and statistics capabilities. The Tektronix TDSJIT2/3 Jitter Analysis software provides many key timing parameter measurements and will extend that capability by making jitter measurements on contiguous clock and data cycles from single shot acquisitions.

M1 by Amherst was used as well and both test methods correlated.

Long–Term Period Jitter is the maximum jitter observed at the end of a period's edge when compared to the position of the perfect reference clock's edge and is specified by the number of cycles over which the jitter is measured. The number of cycles used to look for the maximum jitter varies by application but the JEDEC spec is 10,000 observed cycles.

The NBC4N441 exhibit long term and cycle to cycle jitter, which rivals that of SAW based oscillators. This jitter performance comes with the added flexibility associated with a synthesizer over a fixed frequency oscillator. The jitter data presented should provide users with enough information to determine the effect on their overall timing budget. The jitter performance meets the needs of most system designs while adding the flexibility of frequency margining and field upgrades. These features are not available with a fixed frequency SAW oscillator.
